# Paper 26.50 - Z-Pinch and Shear Claim Contract

CQE-paper-26.50
CQECMPLX Formal Paper Series
Review-facing PDF built 2026-06-12

## Construction Basis

This PDF is the clean paper artifact. Source extracts, kernels, receipts, tool notes, workbook material, and package bindings are used as construction evidence; they are not treated as separate review-facing papers.

## Evidence Inputs

- top-level review source: Papers\Source\CQE-paper-26.50.md

# Paper 26.50 - Z-Pinch and Shear Claim Contract

## Purpose

This contract defines the minimum fields required before a Paper 26 claim can be promoted.

## Required Fields

Each carrier row must provide tape id, index, input bit, integer carrier state when applicable, octonion generator, orient bit, dominant basis index, and shear bit when compared against a second carrier.

Each pinch row must provide transport id, classification, proof boundary, pinch analog state, and a Boolean physical-pinch claim. For Paper 26 the physical-pinch Boolean must remain false.

## Promotion Rules

The following may be promoted:

- period-4 integer carrier closure,
- `e4^2 = -1` and `e4^4 = 1`,
- non-associative octonion path residue,
- fixed-generator shear divergence as a carrier diagnostic,
- pinch as transport-ledger reclassification.

The following promotions are rejected:

- carrier shear to physical plasma shear without a measurement map,
- pinch reclassification to physical collapse,
- orient bit to friction mechanism,
- carrier residue to energy generation,
- horizon analogy to solved physics.

## Linked Review

This paper may speak backward to Paper 25 by inheriting unit and obligation honesty. It may speak forward to Papers 27-29 by exporting a horizon-claim quarantine pattern. It may not feed an unvalidated physical claim backward into the proof stack.
