

Paper 21.75 - MorphForge Next-State Bridge

CQE-paper-21.75

CQECMPLX Formal Paper Series

Review-facing PDF built 2026-06-13

Construction Basis

This PDF is the clean paper artifact. Source extracts, kernels, receipts, tool notes, workbook material, and package bindings are used as construction evidence; they are not treated as separate review-facing papers.

Evidence Inputs

Paper 21.75 - MorphForge Next-State Bridge

Bridge Role

Paper 21 exports an applied-reader discipline to the next papers. It does not export unrestricted proof. The receiving paper gets a verified way to read, encode, account, and place an observation; the receiving paper must still prove its own domain result.

Exported Artifacts

The next state receives:

- the lossless ribbon requirement,
- the S3 fold classifier,
- the morphon ledger schema,
- the explicit open-gap taxonomy,
- the 24-dimensional terminal landing template,
- the hidden-guess diagnostic pattern for non-math validation.

Legal Use

A later paper may map a material, protein, glyph, calendar item, recipe object, CAD wireframe, or game state into the MorphForge reader. It may then state that the object has been read, encoded, accounted, and placed. To state that the object has been solved, optimized, simulated, manufactured, or experimentally confirmed, the later paper must attach a domain verifier.

Illegal Use

A later paper may not claim material closure, protein closure, CAD closure, SolidWorks correctness, chess closure, biological closure, TF1 closure, or Leech closure from Paper 21 alone. Those claims are allowed only as open bridges until their own receipts are present.

Preconditioned Next State

The next paper begins with a cleaner entry condition: the object must first pass the Paper 21 reader. If it cannot be made into a replayable ribbon and an auditable morphon row, then it is not yet ready for a stronger scientific claim. If it can, the later verifier can focus on the domain behavior instead of rebuilding the observation-accounting layer from scratch.
