

Paper 27.75 - Observer Delay Next-State Precondition

CQE-paper-27.75

CQECMPLX Formal Paper Series

Review-facing PDF built 2026-06-12

Construction Basis

This PDF is the clean paper artifact. Source extracts, kernels, receipts, tool notes, workbook material, and package bindings are used as construction evidence; they are not treated as separate review-facing papers.

Evidence Inputs

Paper 27.75 - Observer Delay Next-State Precondition

Purpose

This supplement defines what Paper 27 exports to later papers.

Exported Preconditions

Downstream papers may use:

- shared-center equality as a finite invariant,
- bounded anneal delay as a chart-step lag,
- static four-frame labels as frame metadata,
- the temporal-Z4 refutation as a guard,
- explicit separation between observer receipt and observer interpretation.

Downstream Use

Paper 28 may use shared-center and bounded-delay rows when defining game-lattice observers.

Paper 29 may use the temporal-overclaim guard when discussing energy-bound horizons. Paper 31 may use the read-then-anneal loop as evidence that the whole corpus remains an `(L, C, R)` process.

Kernel Handshake

The kernel sidecar should expose Paper 27 as an observer adapter: receive an `(L, C, R)` row, compute the reflected row, return shared `C`, anneal delay, static Z4 label, and an explicit temporal-period verdict. In training mode, the guess label stays hidden until the reviewer predicts whether a row is a closed finite fact or an interpretive overclaim.
